SUMMARY

Backend-focused full-stack developer (Node.js, Express, PostgreSQL) with hands-on experience building and deploying RESTful APIs with authentication, relational data modeling and third-party integrations.

EDUCATION

Daffodil International University *Dhaka, Bangladesh*

B.Sc. in Computer Science & Engineering *Jan. 2026*

- GPA: 3.72/4.0
- Relevant coursework: Data Structures & Algorithms, Object Oriented Programming, AI/ML

PROJECTS

My Movie Diary | *React, Vite, Node.js, Express.js, PostgreSQL (Supabase), Passport.js* *Aug. 2026*

Live Demo | GitHub Repository

- Built and deployed a RESTful API (Node.js/Express, 10+ endpoints) on Supabase-hosted PostgreSQL, consumed by a React/Vite frontend.
- Implemented authentication and security: PostgreSQL-backed sessions (httpOnly, secure and sameSite cookies), bcrypt hashing (15 salt rounds) and Google OAuth 2.0 via Passport.js; unauthenticated requests to movie routes receive 401; added rate-limiting middleware to limit repeated requests.
- Designed a relational schema (users, movies, sessions) with parameterized SQL queries scoped to the signed-in user; the movie-list endpoint responds in ~99 ms (warm, measured in Chrome DevTools).
- Integrated the third-party OMDb API for poster lookup with a fallback poster, and blocked duplicate entries with a case-insensitive check returning 409 Conflict.
- Wrote 39 integration tests with Vitest and Supertest against an isolated PostgreSQL test database (with a guard that refuses to run on non-test databases), covering authentication, authorization, input validation, CRUD and error handling; mocked the OMDb API to test fallback and network-failure behavior.
- Tested authorization and security: other users get 404 and the data stays unchanged, a mass-assignment attempt on userid is ignored, protected routes return 401, and database failures return a generic 500 without leaking internals.
- Shipped to Render with production CORS, environment-based configuration and SPA routing.

First Cost | *JavaScript, Object-Oriented Programming, MVC, Chart.js* *Jun. 2026*

Live Demo | GitHub Repository

- Applied OOP in an MVC architecture for a client-side personal finance tracker: a model layer, a controller and 10 view classes extending a shared base Views class.
- Built multi-account tracking with 3 transaction types, filtering by 3 criteria, a 4-metric dashboard and 2 Chart.js charts, persisted in localStorage and deployed to GitHub Pages with a single-command Parcel build.

TECHNICAL SKILLS

Backend: Node.js, Express.js, RESTful APIs, Object-Oriented Programming (OOP), authentication and security (session-based auth, OAuth 2.0, bcrypt, secure cookies, CORS), third-party API integration

Databases: PostgreSQL, SQL, relational schema design

Frontend: React, JavaScript, HTML, CSS

Testing: Vitest, Supertest, React Testing Library

Tools & Workflow: Git, GitHub, Postman, Render, environment-based configuration

ADDITIONAL

AWS Cloud Practitioner Essentials (training course) *Sept. 2026*
